About Me

I'm a final-year Data Science student at HCMUS, available full-time in Ho Chi Minh City. I like digging past the totals to find what a dataset is really saying, and I led a 5-person team to win **Business Intelligence Season 10**. Next, I want to learn how analysts at a real company turn data into decisions and explain them to people without a data background.

Education

University of Science, Vietnam National University HCMC — Ho Chi Minh City

Bachelor of Science in Data Science — ***GPA: 3.59/4.00*** — *2023 – 2027 (Expected)*

- **Relevant Coursework:** Database Management Systems (10/10), Data Visualization (9.8/10), Data Mining (9.3/10), Python for Data Science (9.2/10)

Technical Skills

Languages: SQL (PostgreSQL, DuckDB), Python (pandas, NumPy, scikit-learn)
BI & Tools: Power BI (DAX, Power Query, data modeling), Excel, Git
Methods: Star schema & ELT design, cohort analysis, RFM and K-Means segmentation, survival analysis

Projects

Business Intelligence Season 10 (ITB Club, UEL) — Champion — *Sep – Oct 2026*

Python, DuckDB, SQL | Team leader of 5 | github.com/nhaduy-data/bi10-shop-growth-potential

- Recommended one action per shop (invest, pilot, hold or fix risk) for **Home Credit Vietnam**'s **11,752 partner shops**, and presented it to a judging panel that included the company's Head of Sales Planning
- Found the network had no built-in growth: past growth came almost entirely from opening new shops, while **a third of active shops** signed no contract in Q3 2026
- Estimated **16,300 more contracts/month (+41.6%)** within reach by benchmarking each shop against the top 25% of similar shops; 75% of it from sales-agent headcount and productivity
- Built the team's shared cleaning pipeline over **2 GB** of raw files (Python, DuckDB SQL), flagging **36% of leads** with invalid employee IDs before analysis

Customer Lifecycle Analytics — Olist E-commerce — *Jun – Sep 2026*

PostgreSQL, Python, Power BI | github.com/nhaduy-data/customer-lifecycle-analytics

- Caught a join fan-out that **doubled revenue** on multi-item orders, and split orders that inflated the repeat-purchase rate (3.0% → 2.16%), before any analysis
- Built a **PostgreSQL** star-schema warehouse (96,477 orders) and a 5-page **Power BI** dashboard with DAX, Power Query, drill-through and a seller watch-list
- Set churn thresholds at 175 / 288 days from survival analysis; the common 90-day rule would have **misclassified 45%** of customers who later returned
- Showed late delivery hurts ratings (**2.3 vs 4.3 stars**) far more than repeat purchases (2.2% → 1.6%), so the fix belongs to logistics quality, not retention

Certifications & Languages

Google Data Analytics Professional Certificate — Coursera, 2025
English: Professional working proficiency (comfortable reading technical documentation); preparing for TOEIC
